

How Can a Server Benefit Your Business?

What is a Server?

A Server is a powerful computer that holds data to be shared over a network.

The Server responds to requests for information from other computers: it "serves" files, data, print, applications, and more to multiple computers on the same network.

An appropriately configured server can offer:

- File and Network security – manage users, computers, passwords, data access, encryption, etc.
- Increased reliability – built with quality components to ensure high availability & security of your data.
- Centralised Backup – allowing you to retrieve accidentally deleted files and restore previous versions.
- Centralised data storage and shared resources. Providing one central place to store business information, meaning you can better manage business-critical information. It's easier for staff to find, access, and securely share information.
- Give older PCs a new lease of life – by off-loading their files and data onto a server, older PCs work more quickly and effectively – with less chance for data loss!
- Centrally manage Anti-Virus software and Operating System patches.

Donline specialises in server installations utilising best in breed technologies from Microsoft & Fujitsu.

Donline has extensive technical knowledge and expertise in deploying, migrating and supporting server solutions. Whatever your requirements, Donline will find the right server solution to fit the needs of your business!
